4 years*	Quadracel (DTaP #5, IPV #5), Proquad (MMR #2, Varicella #2) Vision screen, TB Screen
5 years	Hearing and vision screens, TB screen

Flu and COVID vaccines:

Raleigh Pediatrics recommends an annual flu vaccine beginning at age 6 months. Children less than 9 years will need a booster at least 4 weeks after the first vaccine if they have not received two doses previously. The COVID vaccine is available for all patients 6 months and up. We give all primary doses and boosters per current dosing guidelines.

***The 12-month and 4-year exams should NOT be done early due to timing of the vaccines.**

Definitions/Abbreviations:

DTaP	Diphtheria, Tetanus, acellular Pertussis (Whooping Cough) (Ages 6 weeks-6 years)
Hep B	Hepatitis B vaccine
Hep A	Hepatitis A vaccine
Hib	Haemophilus influenzae, type B (bacteria that can cause meningitis)
IPV	Inactivated Polio Vaccine
MMR	Measles, Mumps, Rubella,
Varicella	Varicella (Chicken Pox)
Prevnar	Pneumococcal vaccine (bacteria that can cause meningitis)
Rotavirus	Oral vaccine against a common intestinal virus

EPDS	Edinburgh Postpartum Depression Screening (routinely done between 1-6 months old)
M-CHAT-R	Autism screening tool (routinely done at 18 months and 2 years)
PEDS-R	Parent evaluation of development status (at intervals between 6 months – 5 years)

Raleigh Pediatric Associates Well Child Check-Up and Immunization 2026 Schedule Summary

Annual Well Exams Age 5 and older:

After 5 years, well child exams are recommended every year. Raleigh Pediatrics requires yearly well exams for patients who are taking medications for chronic problems such as Asthma and ADHD.

Each well exam includes a growth and weight evaluation, a full developmental assessment, and a complete physical examination. Screenings may include TB, vision, hearing, and appropriate labs such as lipid panel, HbA1C or CBC.

All patients aged 11-22 will be given the RAAPS (Rapid Adolescent Assessment for Preventative Services) to screen for behavior/psychosocial concerns.

Adolescent vaccines:

- Meningitis vaccines:
 - Meningitis ACWY given routinely at the 11-year well child visit (Required for 7th grade school entry), one booster after 16 years old (Required for 12th grade school entry).
 - MenB vaccine optional between ages 16-18 (2 doses given 6 months apart)
- Tdap - can be given after 6 years old but is usually done at 11-13 year well child check. (Required for 7th grade school entry)
- HPV - given starting at 10-year well child check (If series started before age 15, then two doses are given 6 months apart; if series started at 15+, then three doses of the vaccine are given at 0-, 2-, and 6-month intervals)
- Varicella - second chickenpox booster if has not already had 2 or confirmed history of disease

Flu and COVID vaccines:

Raleigh Pediatrics recommends an annual flu vaccine beginning at age 6 months. Children less than 9 years will need a booster at least 4 weeks after the first vaccine if they have not received two doses previously. The COVID vaccine is available for all patients 6 months and up. We will give all primary doses and boosters per current dosing guidelines.

Definitions/Abbreviations:

Tdap	Tetanus, Diphtheria, acellular Pertussis (Ages 7+)
Varicella	Varicella (Chicken Pox)
Meningitis ACWY	Meningitis vaccine (protects against meningococcal disease caused by the ACWY serogroups)
MenB	Meningitis B vaccine (protects against meningococcal disease caused by the B serogroup)
HPV	Human Papilloma vaccine (protects against cancer-causing virus)
TB	Tuberculosis
CBC	Complete Blood Count—checks hemoglobin (blood test for anemia)
